

AI AND ANALYTICS USING ZIA

Aim:

To explore and utilize Zia (Zoho's Artificial Intelligence assistant) and Zoho Analytics for performing intelligent data analysis, generating automated insights, predictions, and visualizations from application data.

Procedure:**1. Sign in to Zoho Account**

- Open a browser and go to the respective Zoho application (Zoho Creator/Zoho Analytics).
- Log in with a valid Zoho account.
- Open the application/workspace where the data is already available.

2. Enabling Zia in Zoho Creator

- Navigate to the application's Settings.
- Locate and enable the Zia feature (AI-powered assistant) for the application.
- Zia analyzes existing form data and field patterns to enable smart suggestions.

3. Using Zia for Data Entry Assistance

- Open a form where Zia is enabled.
- Use Zia Voice/Text-based data entry to add records using natural language commands (e.g., "Add a new customer named John with phone number...").
- Use Field Prediction — Zia auto-suggests values for fields based on historical data patterns.
- Use Anomaly Detection — Zia flags unusual or inconsistent data entries automatically (e.g., an abnormally high order amount).

4. Setting Up Zoho Analytics Workspace

- Go to analytics.zoho.com and log in.
- Create a New Workspace for the project.
- Import data by connecting directly to the Zoho Creator application, uploading a file (CSV/Excel), or connecting to a database/URL.

5. Creating Reports in Zoho Analytics

- Select the imported table(s).
- Click Create Report and choose the report type (Chart, Pivot Table, Summary View, Tabular View).
- Drag and drop the required dimensions and measures into the report designer.
- Apply filters and formatting as needed.

6. Using Zia (Ask Zia) in Zoho Analytics

- Open the Ask Zia search bar within the workspace.
- Type a natural language query about the data (e.g., "Show total sales by region for 2025").
- Zia automatically interprets the query and generates the appropriate chart/report as output.
- Refine the query if needed to get a more specific visualization.

7. Predictive Analysis Using Zia

- Select a report/table suitable for forecasting (e.g., sales trend data).
- Use the Forecasting option under Zia-powered analytics.
- Zia applies AI/ML algorithms to predict future trends (e.g., next month's sales) and displays them as a forecast chart.

8. Building Dashboards

- Combine multiple Zia-generated and manually created reports into a single Dashboard.
- Arrange components, apply themes, and add filters for interactivity.

9. Publish and Share

- Publish the dashboard/workspace.
- Share access with relevant users/stakeholders with appropriate permission levels (View/Edit).

Result:

Thus, Zia and Zoho Analytics were successfully used to perform AI-driven data entry assistance, anomaly detection, natural language querying, and predictive analysis. Intelligent reports and dashboards were generated automatically using Zia's capabilities, enabling faster and more accurate data-driven decision-making.
